

Credit Platform - Analytics Engineer - Analysis exercise

Background: You are provided with a sample dataset containing two worksheets of data.

The first worksheet contains the credit card offers received by customers applying for credit cards on a marketplace platform that hosts a panel of 34 credit cards. Each row represents a single credit card offer returned by some lender (i.e. the applicant is preliminarily approved for that particular card). Each applicant may or may not receive more than one offer, hence you will note some application IDs are duplicated across more than one row, to reflect the multiple credit card offers received.

As the process goes, the applicant sees the credit card offers returned on a results page, clicks on their preferred credit card offer (if any), and is redirected to the respective lender's domain in order to complete the process. After clicking out, the applicant may or may not actually receive the selected credit card, due to various reasons (e.g. additional creditworthiness/affordability information changes the lender's decision, customer may change mind, bad UX, etc.).

The second worksheet contains summary information around what happened post-clickout (i.e. conversion/sales) for the same applicants covered in the first worksheet, over the same time period.

Task: You are asked to analyse the information and investigate whether any particular card is harming the performance of the panel (i.e. the credit card panel – and hence the credit card marketplace product - would be better without it).

Deliverables:

1. One or two slides in Microsoft PowerPoint to answer the question, which should be styled as a report rather than a presentation (you will not be given a chance to present it – instead imagine the slides are going straight to a senior stakeholder for perusal).
2. Your underlying excel workings (you need not spend time to “tidy these up”, but for any graphs used in the PowerPoint, one should be able to trace back to the data underpinning them)

Note: Instead of the right answer, we are more interested to see how you approach the problem and how you communicate this and your findings.

We thank you for taking the time to perform this exercise,

The Ocean Finance team.
